

Figure 10: Evolution of metrics over 100 equal-count bins within the high state. The plot shows seven metrics: event_speed, event_gross_volume, event_raw_btc_per_second, event_relative_flow_rate, time_event_count, time_gross_volume, and time_relative_flow_rate. The x-axis represents the number of equal-count bins within the high state, ranging from 20 to 100. The y-axis represents the value of each metric. The time_event_count metric is the highest, followed by time_relative_flow_rate, time_gross_volume, event_gross_volume, event_relative_flow_rate, event_raw_btc_per_second, and event_speed.

Equal-count bins within high state	event_speed	event_gross_volume	event_raw_btc_per_second	event_relative_flow_rate	time_event_count	time_gross_volume	time_relative_flow_rate
20	~1.5	~1.5	~1.5	~1.5	~100	~1.5	~1.5
40	~1.8	~1.8	~1.8	~1.8	~100	~1.5	~1.8
60	~2.0	~2.0	~2.0	~2.0	~100	~1.5	~2.0
80	~2.0	~2.0	~2.0	~2.0	~100	~1.5	~2.0
100	~2.0	~2.0	~2.0	~2.0	~100	~1.5	~2.0

Figure 10 is a line plot showing the relationship between Mean normalized imbalance in tail interval (x-axis) and Observed impact minus central log prediction (y-axis) for seven different metrics. The x-axis is on a logarithmic scale, ranging from 3×10^{-3} to 2×10^{-2} . The y-axis ranges from 0.00 to 0.25. The metrics are: event_speed (blue), event_gross_volume (orange), event_raw_btc_per_second (green), event_relative_flow_rate (red), time_event_count (purple), time_gross_volume (brown), and time_relative_flow_rate (pink). All metrics show a positive correlation, with time_event_count and time_gross_volume reaching the highest values of approximately 0.24 at the highest imbalance level.
